

Girls' Programming Network

Bop It with Micro:Bits!

This project was created by GPN Australia for GPN sites all around Australia!

This workbook and related materials were created by tutors at:

Sydney and Canberra

Girls' Programming Network

If you see any of the following tutors don't forget to thank them!!

Part 0: Setting up

Task 0.1: Logging into Grok

Let's get started with Grok!

1. Go to <https://groklearning.com/>
2. Log into an account you already have, or create one.
Ask a tutor if you need help!
3. Watch the tutors demonstrate how to access the course for today!

Task 0.1: Grok On

First we're going to do a few fun problems in Grok to teach us about programming micro:bits.

1. Go through the GPN Bop It Intro Module and answer all the questions!

Hint

Don't forget to use your cheat sheets!

☑ CHECKPOINT ☑

If you can tick all of these off you can go to Part 1:

- ☐ You are logged into your Grok account
- ☐ Your workspace has a program.py file in the Code tab
- ☐ You have completed all the problems in the Grok intro module

Today's Project Plan - Bop It

We're going to make a Bop It game!

It will prompt the user to press Button A or B to get points!

Get as many points as you can in the time limit.

1

Start off the game by showing a starting image!

2

List your actions, and choose a random action to be the first move!

3

Display different images on the screen depending on what action you chose!

4

Add a loop to make it choose and display actions over and over again!

5

Make the game wait for you to complete the action. Get a smiley and new move when you're correct!

6

Add scores to the game and show the final score at the end of the game!

+ more

Once your base game works add cool extensions!

There's extensions sounds, making your own buttons out of foil, using radio communication to make multiplayer games and many more!!

Part 1: Ready! Set! Go!

We need to know the game is starting!

Display an image that tells the player the game is starting!

Task 1.1: A new file!

Now you've finished the problems in Grok, we can go to the first Micro:Bit playground!

1. Go to the first Micro:Bit playground in the Grok course.
2. At the top of the file add a new line (above the import line) use a comment to write your name.

Hint

Remember comments start with a #

This is a comment

Task 1.2: Starting your game

To show that the game is starting let's show a target image for 1 second!

1. After your `comment` use `display.show()` to show a target. (called `Image.TARGET`)
2. Make the program `sleep` for 1000 milliseconds. Use `sleep(1000)`
3. Then `clear` the display with `display.clear()`

✓ CHECKPOINT ✓

If you can tick all of these off you can go to Part 2:

- ☐ Your program shows a target at the start of the game for one second and then clears the display.
- ☐ You tried it on your real life Micro:Bit

Part 2: Choosing a move

Our game is about doing random actions!

Let's start by choosing the first move!
What will be Button A or B?

Task 2.1: Making a list of actions

We need to make a list of actions to refer to later.

1. At the end of your code, create a `list` called `actions`.
2. Inside the `list` store the two actions `"button a"` and `"button b"`.

Hint

Remember a `list` looks like this:

```
good_foods = ["pizza", "curry", "nutella", "omelette"]
```

Task 2.2: Get random

To randomly select actions in our game we'll need to import a special library.

1. Add a new line after `from microbit import *` line
2. On this line write `import random`

Task 2.3: Selecting the next action

Now we'll use the library to choose a move from our list of actions.

1. Make a new line after our list of `actions`.
2. Choose a random action from the list of `actions`. Assign it to a variable called `action`.
3. Then `print` the `action` so we can see what it is.
It will print in the Grok output, not on the Micro:Bit

Hint

Remember we can choose something randomly from a list like this:

```
food_list = ["pizza", "curry", "nutella", "omelette"]  
dinner = random.choice(food_list)
```

Task 2.4: Check that it works!

Now you need to run your program a few times to check that it is working!

1. Run your code multiple times. See what action it prints out.

Do you get different actions?

You might get the same one a few times in a row.

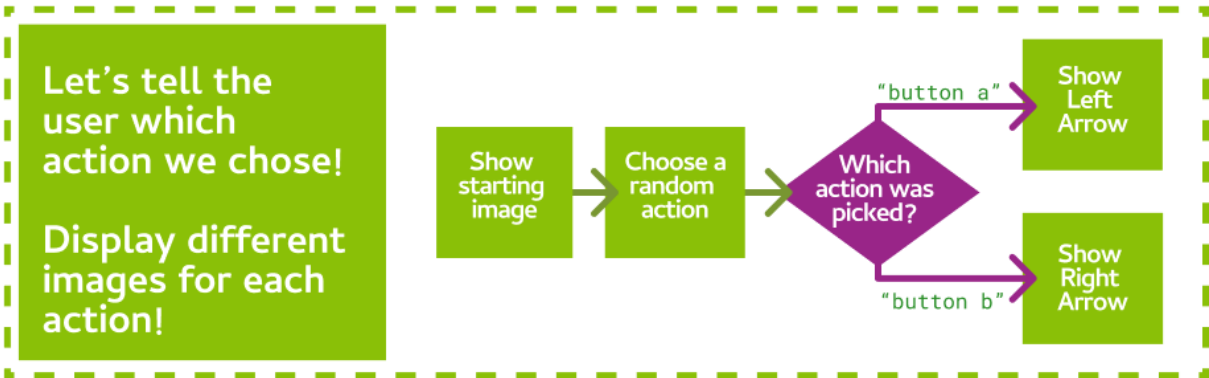

✓ CHECKPOINT ✓

If you can tick all of these off you can go to Part 3:

- ☐ You have a list of **actions**
- ☐ You choose an action using **random**
- ☐ You have the next **action** stored in a variable
- ☐ You have a print statement that **prints** out the **action**

Part 3: Light it up!

Task 3.1: What's your action?

In part 2, you made two **actions** your game can choose from.
Do you remember what they were called?

Write their names down below:

1)

2)

Task 3.2:

We want to point to the button the player should press.

Which action will we show these images for?

	
Image.ARROW_W	Image.ARROW_E
Action:	Action:

Task 3.3: Giving the first action a picture

Let's check what action was selected and display a picture!

1. At the bottom of your code create an `if` statement
2. The if statement should check if the action the computer chose is `"button a"`.
3. Inside the `if` statement, use `display.show()` to show the arrow that points to **Button A**. Make sure it's indented.

Hint

Remember `if` statements have indentation. Here's an example about the weather:

```
if raining == True:
    print ('oh no!')
```

Task 3.4: Giving the second action a picture

Now we'll do the same for the other action

1. After that if statement, create another `if` statement.
2. This time check if `"button b"` is the action.
3. Inside this `if` statement, display the arrow that points to **Button B**.

Task 3.5: Testing time!

Run your code!

1. Check in the Grok console to see which `action` was selected.
2. Does it `print` out the correct picture for the action?
3. Run your program multiple times to check both actions!

✓ CHECKPOINT ✓

If you can tick all of these off you can go to Part 4:

☐ When you run the program, it shows **one** of the pictures below

Picture 1:

Picture 2:

☐ If you run the program multiple times, it shows the **other** picture sometimes. (This might take a few goes)

★ BONUS 3.6: Choose your own pictures! ★

Waiting for the next lecture? Try adding this bonus feature!!

Instead of showing left and right arrows, let's choose our own pictures!

- Replace the code that shows the **left arrow** with `Image.SQUARE`
- Replace the code that shows the **right arrow** with `Image.HEART`

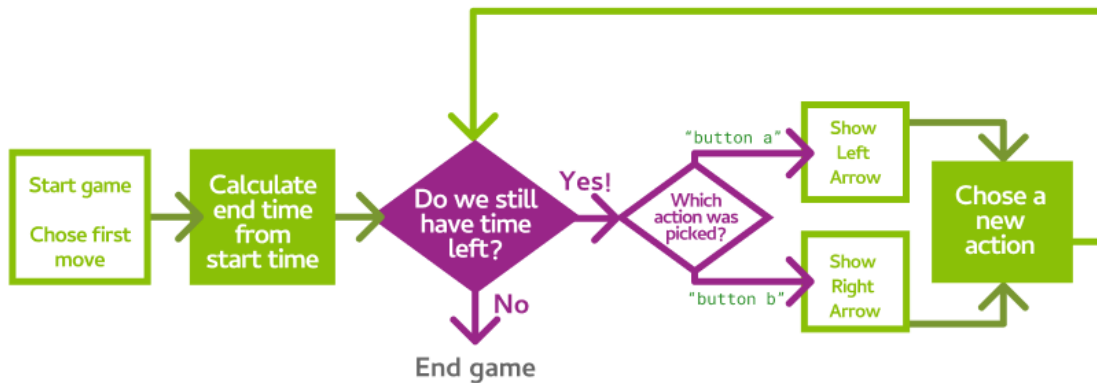

What do you see when you run the program? What if you restart the program a few times?

Find more images on the *Micro:Bit Image Cheat Sheet*: <http://bit.ly/images-microbit>

Part 4: The more actions the merrier!

One action is not enough for a game!

Let's make it play on a loop and show new actions for 10 seconds!

Task 4.1: Looping for 10 seconds

So we know when to stop the game, we need to know when it started!

1. Make a new line after you randomly choose an **action**.
2. Ask the Micro:Bit how long the game has been running by using `running_time()`.
3. Store the `running_time()` in a variable called `start_time`.
4. On the next line, create a variable called `end_time`, set it to `start_time` plus 10000 milliseconds. *You can change this later if you want a longer game!*

Task 4.2: Here we go again!

Now let's add the loop that goes until the `end_time`!

1. Go to the next line after you set the `end_time`.
2. Add a **while** loop with a condition that checks that the current `running_time()` is less than the `end_time`.
3. **Indent** all the code that is below this line (your if statements), so it is inside the **while** loop.

Hint - While Loops

Your **while** loop should have a structure similar to this example:

```
while raining == True:
    print ('Raindrops keep falling on my head')
```

Task 4.3: Wait a second and then change the action

We already show the image for the first action we choose! Let's wait 500 milliseconds, then choose a new action.

1. Go to the end of your code, and make a new line. It **should be indented** inside the **while** loop, **but not** inside the last **if** statement.
2. **sleep** for 500 milliseconds.
3. After the **sleep**, update the value of **action** by choosing a new one from the list of **actions** again.

Hint

To overwrite a variable just assign something new to it!

You can use the same code you used in **Task 2.3** to pick the first random move.

✓ CHECKPOINT ✓

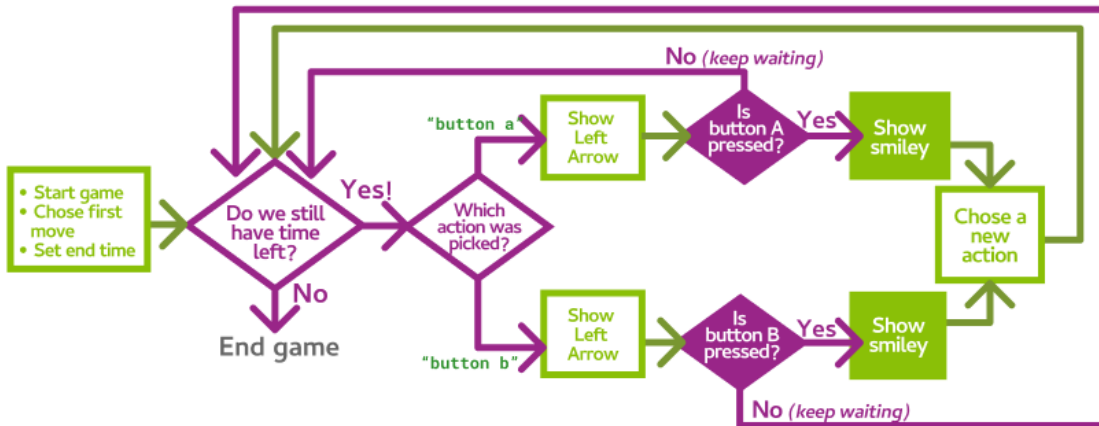

If you can tick all of these off you can go to Part 5:

- ☐ Your game runs for 10 seconds
- ☐ Your game keeps choosing new random actions
- ☐ Your game updates to the correct picture for the new action

Part 5: Button Presses

You can't have a Bop It game without Buttons!

Let's make the game wait for you to complete the action.
Get it right to get a smiley face and a new action!

Task 5.1: If Button A is pressed

If the action is `button_a`, then we want to check whether `button_a` has been pressed.

1. Go to where you show the image for when the action is `"button a"` and create a new line.
2. Create another `if` statement on the new line.
Make this line is indented inside your existing `if` statement.
3. Make this new `if` statement check whether `button_a.is_pressed()`.
4. Indented inside the new `if` statement, display a smiley face to celebrate!

Hint - Showing a Happy Face

The image for a smiley face is: `Image.HAPPY`

Hint - errors with `is_pressed`

Look at the end of this line of code, **notice the brackets at the end:**

```
button_a.is_pressed()
```

Make sure you include the brackets!

The brackets make it so we **call** the function and check if the button is pressed!

Task 5.2: Else, when Button A is not pressed

When `button_a` has not been pressed, we should continue the game.

1. Add an `else` statement for if the button is not being pressed.
2. Inside that `else` statement, add `continue`.

Hint - Else

Your `if-else` statement should have a structure similar to this example:

```
if raining == True:
    print ('oh no!')
else:
    print ('Yay!')
```

Don't forget that indentation is important!

Task 5.3: Button B Pressed?

Now it's `button_b`'s turn!

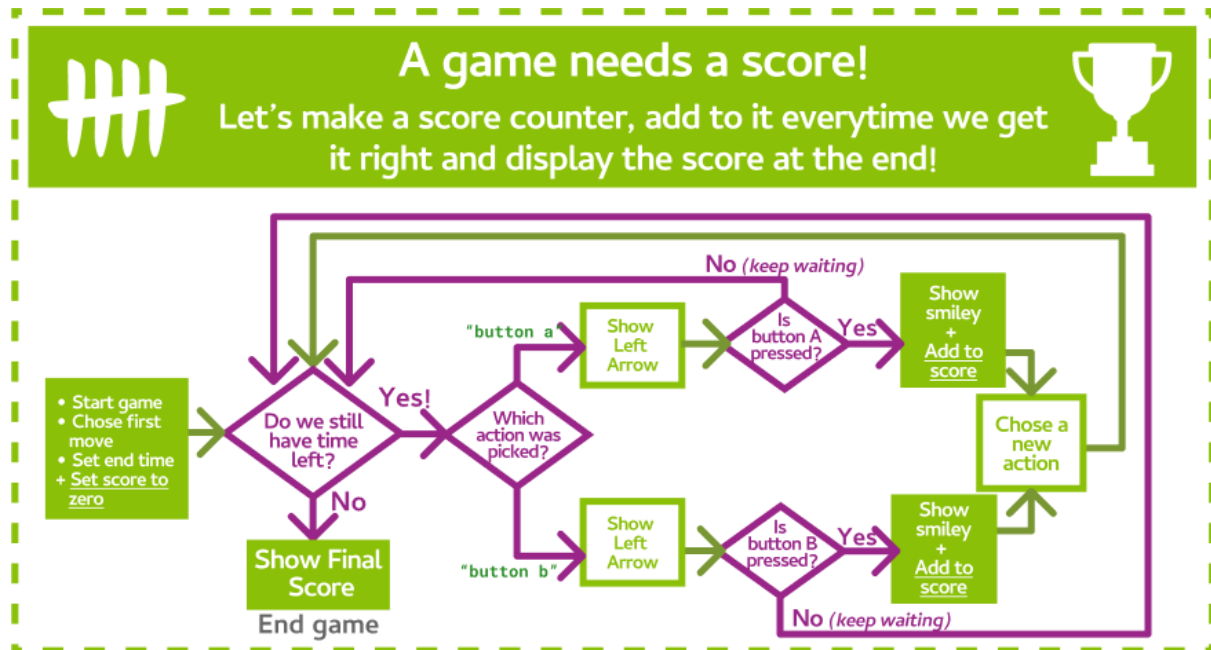

1. Inside the `if` statement that checks to see if the action is `button_b`, add an `if` statement that checks to see if `button_b.is_pressed()`.
2. Add an `else` to the `if` statement, that has a `continue`.

✓ CHECKPOINT ✓

If you can tick all of these off you can go to Part 6:

- ☐ When the action is `"button a"` and you press `button_a`, a smiley face is displayed.
- ☐ When the action is `"button b"` and you press `button_b`, a smiley face is displayed.
- ☐ Your game waits on the same move until you press the correct button.

Part 6: Scoring

Task 6.1: Let's get this scoring party started!

Create a variable to keep track of the score.

1. Create a new line in your code before the **while** loop starts.
2. Here, create a variable called `score` and set it to 0.

Task 6.2: Get those points!

Every time the correct move is made, add 1 to the score.

1. Go to your if statement where you check if **button A** was pressed.
2. Create a new line after you show the smiley face.
3. On the new line, add 1 to the score variable.
4. Repeat for the other action.

Hint

When we want to add to an existing variable it looks like this example:

```
num_apples = 5
num_apples = num_apples + 1
```

Task 6.3: How did you do?

Now we need to tell the player how well they did!

1. Got to the end of the program, after the `while` loop finishes.
2. Convert the final score to a string and the `scroll` it across the display.

Hint

To scroll a number of the screen we need to convert it to a string. We can use `str` to convert to a string inside our scroll, like this:

```
fave_num = 317  
display.scroll(str(fave_num))
```

✓ CHECKPOINT ✓

If you can tick all of these off you can go to the Extensions:

- ☐ You have a score variable that is set to 0 at the start of the program
- ☐ At the end of the game, the score scrolls across the display
- ☐ You have made sure that the score counts to the right number

Extension Map
