Start of Day Survey

# Today's project!

Markov Chains!

# What is a Markov Chain?

A Markov chain is a simple Artificial Intelligence!

Let's play a game with some cups to help explain it

# Let's play the cups game!

Let's generate some text in the style of  
Green Eggs & Ham by Dr Seuss

Do you like green eggs and ham?

I do not like them, Sam-I-am.

I do not like green eggs and ham.

Would you like them here or there?

I would not like them here or there.

I would not like them anywhere.

# Let's play the cups game!

- Each cup is **labelled** with a word from Green Eggs and Ham
- Each cup **contains** the words that follow the "label" word in Green Eggs and Ham

We're going to write some text by randomly choosing a next word based on the word before it

# Let's play the cups game!

Read the outside of your cup!

**If** someone shouts the word on the outside of your cup:

1. Pick a piece of paper from inside your cup
2. Shout out the word on the piece of paper
3. Put the piece of paper back in your cup

A tutor will write the words called out on the board

# Today we'll be making Markov Chains!

**Markov chains are exactly what we just did with the cups!**  
**Today we'll make the computer do it to make some crazy stories!!**

Here's one we made from some Shakespeare!

doth stay! All days when I compare thee to unseeing eyes  
be blessed made By chance, or eyes can see, For all the  
top of happy show thee in dark directed. Then thou, whose  
shadow shadows doth stay! All days when I compare thee in  
your self in inward worth nor outward fair, Can make  
bright, How would thy shade Through heavy sleep on the eye  
of life repair, Which this, Time's pencil, or my pupil  
pen, Neither in the living day, When in eternal lines of  
that fair from fair thou grow'st, So should the lines to a  
summer's day?

**Imagine if you used one of these to do your homework!!**

# Signing up to Edstem

Log in if you already have a an “Edstem” account from a past GPN

Already have an account? [Log in](#)

If you haven't got an account, let's make one:

1. Type in your Full Name
2. Type in your personal email
3. Click Create Account
4. Go to your email and verify your new account
5. Create a password

A screenshot of the Edstem account creation form. It has a dark blue background. At the top, it says 'Full name' above a white text input field with a blue border. Below that, it says 'Email' above another white text input field containing the text 'you@girlsprogramming.network'. At the bottom, there is a large blue button with the text 'Create account' in white.

Click Join Course

Join course

The name of your course will be at the top : —————>

Markov P

*If you don't have access to your email account, ask a tutor for a GPN Edstem login*

# Signing up to Edstem

We are shifting all our courses to a new website called “Edstem” so here’s an overview of how to sign up and how to use it.

First let’s go through how to create an account.

1. Follow this link: **<https://edstem.org/au/join/afrJT9>**
2. Type in your name and your personal email address
3. Click Create Account
4. Go to your email to verify your account
5. Create a password
6. It should then take you to the courses home page.
7. Click on the one we will be using for this project:

Markov P  
Markov Chains

# Getting to the lessons

1. Once you are in the course, you'll be taken to a discussion page.
2. Click the button for the lessons page (top right - looks like a book)

# The set up of the workbook

## The main page:

1. Heading at the top that tells you the project you are in
2. List of “Chapters” called something like **1:Welcome Message**  
They have an icon that looks like this:  

3. To complete your project, work through the chapters one at a time

1: Welcome message

2: The first word

3: What comes next?

# Inside a Chapter

Inside a Chapter there are two main types of pages:

- **Lessons** where you will do your coding.
  - They have this icon:

- **Checkpoints**

Checkpoint

Each chapter has a checkpoint to complete to move to the next chapter. Make sure you scroll down to see all the questions in a checkpoint.

There may also be **Bonus Lessons** to try if you want to or if you are waiting for the next lecture

≡ 1: Welcome message

1.1 Print a message

Checkpoint

1.1 Print a message

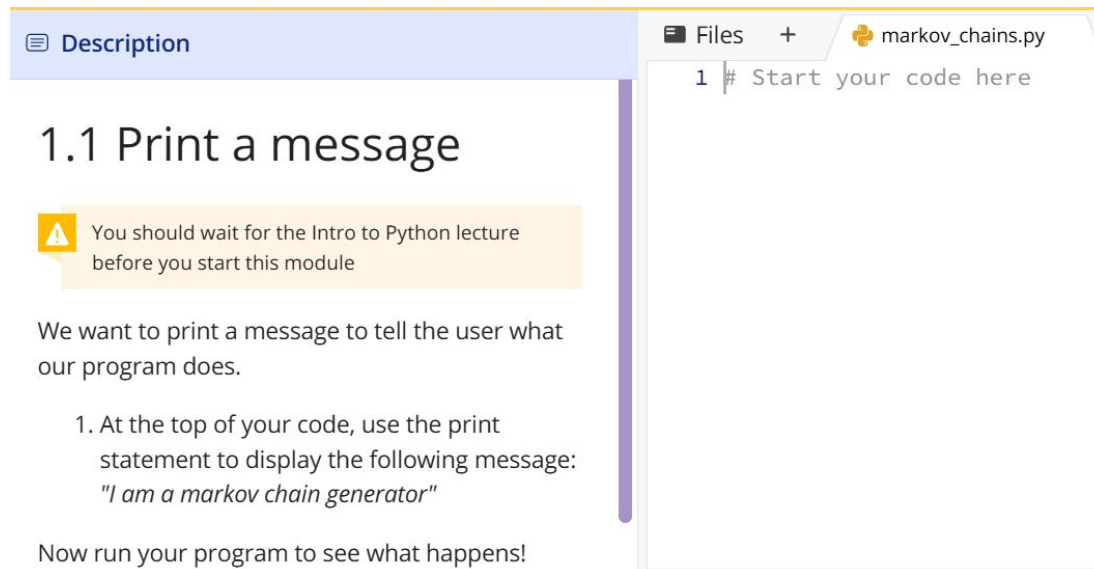

Checkpoint

# How to do the work

In each Lesson there is:

1. A section on the left with instructions
2. A section on the right for your code

You will need to **copy your code from the last lesson**, then follow the instructions to change your code

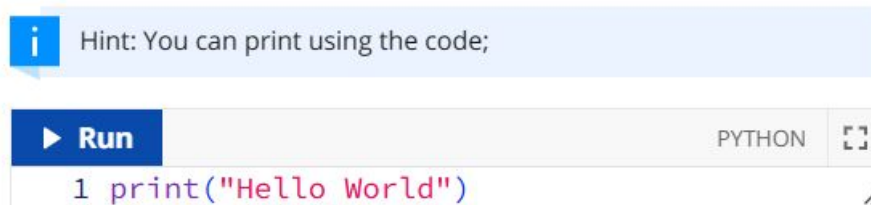

The screenshot shows a web-based coding environment. On the left, under a 'Description' tab, is the lesson title '1.1 Print a message'. Below the title is a yellow warning box with an exclamation mark icon and the text: 'You should wait for the Intro to Python lecture before you start this module'. Further down, it says 'We want to print a message to tell the user what our program does.' followed by a numbered list: '1. At the top of your code, use the print statement to display the following message: *"I am a markov chain generator"*'. At the bottom of the description, it says 'Now run your program to see what happens!'. On the right, there is a code editor window titled 'markov\_chains.py' with a single line of code: '1 # Start your code here'.

There are also  
Hints and  
Code Blocks to  
help you

# Hints

Sometimes in a lesson, there's some code we want you to do that might be a bit tricky, to help you out we've added some hints. They look like this:

If you press the blue run button it will show you what that code does, you can even change the code to see if/how it changes.

These are **just hints** make sure you're not copying the hint into your code as it will likely end up breaking. They are just to show you the kinds of things you can do.

# Running your code...

Click  in the bottom right hand corner  
Your code will run and any output will display in the Console

Description

## 1.1 Print a message

 You should wait for the Intro to Python lecture before you start this module

We want to print a message to tell the user what our program does.

1. At the top of your code, use the print statement to display the following message:  
*"I am a markov chain generator"*

Now run your program to see what happens!

Files + markov\_chains.py

```
1 print("I am a markov chain generator")
```

/home/markov\_chains.py 1:10 Spaces: 4 (Auto) All changes saved

Console Terminal

I am a markov chain generator

✓ Program exited with code 0

 Run

Don't worry if you forget. Tutors will help!

# Some shortcuts...

There are a couple things you can do to make copying your code from one page to another easier.

- 1. Ctrl + A** Pressing these keys together will select all the text on a page
- 2. Ctrl + C** Pressing these keys together will copy anything that's selected
- 3. Ctrl + V** Pressing these keys together will paste anything you've copied

On Macs use Command (⌘) instead of Ctrl

# Project time!

You now know all about the EdStem!

**You should now sign up and join our  
EdStem class.**

Remember the tutors will be around to help!

# Intro to Python

Let's get coding!

# Let's make a mistake!

Click on Chapter 1 '**Welcome message**'

The first lesson '1.1 Print a message' will open. It looks like this

## Markov Chains

1.1 Print a message

Discussion is set to read only

1: Welcome message

1.1 Print a message

Checkpoint

**Description**

**1.1 Print a message**

You should wait for the Intro to Python lecture before you start this module

We want to print a message to tell the user what our program does.

1. At the top of your code, use the print statement to display the following message:  
*"I am a markov chain generator"*

Now run your program to see what happens!

Files + markov\_chains.py

```
1 # Start your code here
2 |
```

/home/markov\_chains.py 2:1 Spaces: 4 (Auto) All changes saved

Console Terminal Run

# Let's make a mistake!

**Description**

## 1.1 Print a message

You should wait for the Intro to Python lecture before you start this module

We want to print a message to tell the user what our program does.

1. At the top of your code, use the print statement to display the following message:  
*"I am a markov chain generator"*

Now run your program to see what happens!

**Files** + markov\_chains.py

```
1 # Start your code here

Console Terminal **Run**

Type by **button mashing** the keyboard here - type anything you want

**Click** Run here to run your code!

## Did you get a big ugly error message?

Console Terminal

```
sknvvgj6489TEmdjs;shg
AAAAAAAAAAAAAAAAAAAA
NameError: name 'sknvvgj6489TEmdjs' is not defined
```

# Mistakes are great!

*SyntaxError:  
Invalid Syntax*

**Good work you made an error!**

*ImportError  
No module  
named humour*

- Programmers make A LOT of errors!
- Errors give us hints to find mistakes
- Run your code often to get the hints!!
- Mistakes won't break computers!

*KeyError:  
'Hairy Potter'*

*AttributeError:  
'NoneType' object  
has no attribute  
'foo'*

*TypeError: Can't  
convert 'int' object  
to str implicitly*

# Write some code!!

This is the first bit of code we will do. What do you think it does?

```
print('hello world')
```

# Write some code!!

This is the first bit of code we will do. What do you think it does?

```
print('hello world')
```

It prints the words “hello world” onto the screen!

# Variables

## **Variables are useful for storing things that change**

(i.e. things that "vary" - hence the word "variable")

You can think of it like  
putting information in a  
box and giving it a label

# Variables

When coding, we can make a variable called **friend** and set it to a value like this

**friend = "Alex"**

# Variables

Instead of writing the word “Alex”, we can write **friend** (the variable’s name).

The computer will substitute the current value of friend.

It’s like we’re getting the value out of the box!

```
print(friend)
```

# Variables

Instead of writing the word “Alex”, we can write **friend** (the variable’s name).

The computer will substitute the current value of friend.

It’s like we’re getting the value out of the box!

```
print(friend)
```

Alex

# Reusing variables

We can replace values in variables:

```
animal = "dog"
print("My favourite animal is a " + animal)
animal = "cat"
print("My favourite animal is a " + animal)
animal = animal + "dog"
print("My favourite animal is a " + animal)
```

What will this output?

# Reusing variables

We can replace values in variables:

```
animal = "dog"
print("My favourite animal is a " + animal)
animal = "cat"
print("My favourite animal is a " + animal)
animal = animal + "dog"
print("My favourite animal is a " + animal)
```

What will this output? `My favourite animal is a dog`  
`My favourite animal is a cat`  
`My favourite animal is a catdog`

# Asking a question!

It's more fun when we get to interact with the computer!

**Let's get the computer to ask us a question!**

```
my_name = input('What is your name? ')\nprint('Hello ' + my_name)
```

This is what happens ...

What is your name? Maddie

Hello Maddie

1. Computer prints 'What is your name?'
2. Computer waits for you to type in your name
3. Computer prints 'Hello Maddie'

# Breaking it down

Store the answer  
in the variable  
my\_name

```
my_name = input('What is your name? ')\nprint('Hello ' + my_name)
```

What do you think happens?

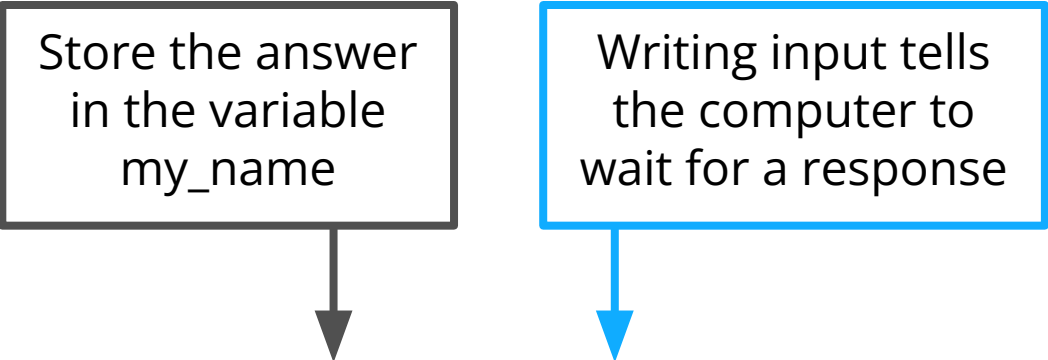

What is your name? Maddie

Hello Maddie

# Breaking it down

Store the answer  
in the variable  
my\_name

Writing input tells  
the computer to  
wait for a response

```
my_name = input('What is your name? ')\nprint('Hello ' + my_name)
```

What do you think happens?

What is your name? Maddie

Hello Maddie

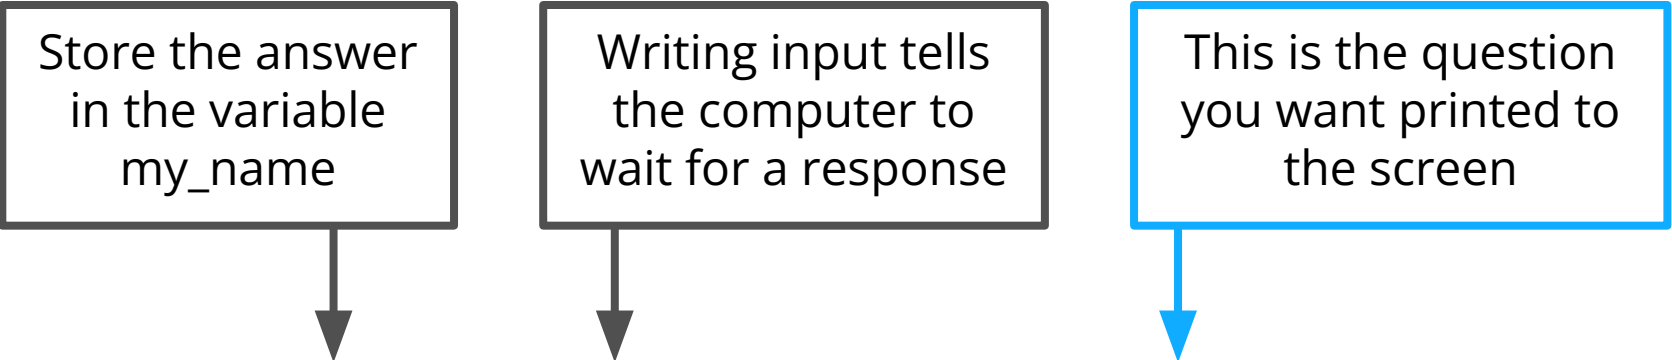

# Breaking it down

Store the answer  
in the variable  
my\_name

Writing input tells  
the computer to  
wait for a response

This is the question  
you want printed to  
the screen

```
my_name = input('What is your name? ')\nprint('Hello ' + my_name)
```

What do you think happens?

What is your name? Maddie

Hello Maddie

# Breaking it down

Store the answer  
in the variable  
my\_name

Writing input tells  
the computer to  
wait for a response

This is the question  
you want printed to  
the screen

```
my_name = input('What is your name? ')\nprint('Hello ' + my_name)
```

What do you think happens?

What is your name? Maddie

Hello Maddie

We can use the answer  
the user wrote that we  
then stored later!

# Breaking it down

**Big Tip** : Put a space at the end of the question so it won't be squished together with your answer - it looks nicer!

```
my_name = input('What is your name? ')\nprint('Hello ' + my_name)
```

**SPACE** 😊

```
What is your name? Maddie\nHello Maddie
```

**NO SPACE** 😞

```
What is your name?Maddie\nHello Maddie
```

# Adding a comment!

Sometimes we want to write things in code that the computer doesn't look at! We use **comments** for that!

Use comments to write a note or explanation of our code  
Comments make code easier for humans to understand

```
# This code was written by Sheree
```

We can make code into a comment if we don't want it to run (but don't want to delete it!)

```
# print("Goodbye world!")
```

# Project time!

You now know all about printing, variables and input!

**Let's put what we learnt into our project**  
**Try to do Lessons 1 & 2**

Don't forget to copy your code when you move to a new Lesson!

The tutors will be around to help!

# If Statements and Lists

# Conditions!

**Conditions let us make decision.**  
**First we test if the condition is met!**  
**Then maybe we'll do the thing**

**If it's raining** take an umbrella

**Yep it's raining**

**..... take an umbrella**

# Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5  
if fave_num < 10:  
    print("that's a small number")
```

# Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
```

What do you think happens?

```
>>>
```

# Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
```

What do you think happens?

```
>>> that's a small number
```

# Conditions

How about a different number???

```
fave_num = 9000
```

```
if fave_num < 10:
```

```
    print("that's a small number")
```

What do you think happens?

```
>>>
```

# Conditions

How about a different number???

```
fave_num = 9000
```

```
if fave_num < 10:
```

```
    print("that's a small number")
```

What do you think happens?

```
>>>
```

Nothing!

# If statements

```
word = "GPN"  
if word == "GPN":  
    print("GPN is awesome!")
```

What happens?

# If statements

```
word = "GPN"  
if word == "GPN":  
    print("GPN is awesome!")
```

What happens?

```
>>> GPN is awesome!
```

## Remember ...

**==**

**When testing for equals in your condition**

**:**

**At end of each if line to say you have finished writing your condition**

# If statements

```
word = "GPN"  
if word == "GPN":  
    print("GPN is awesome!")
```

What happens?

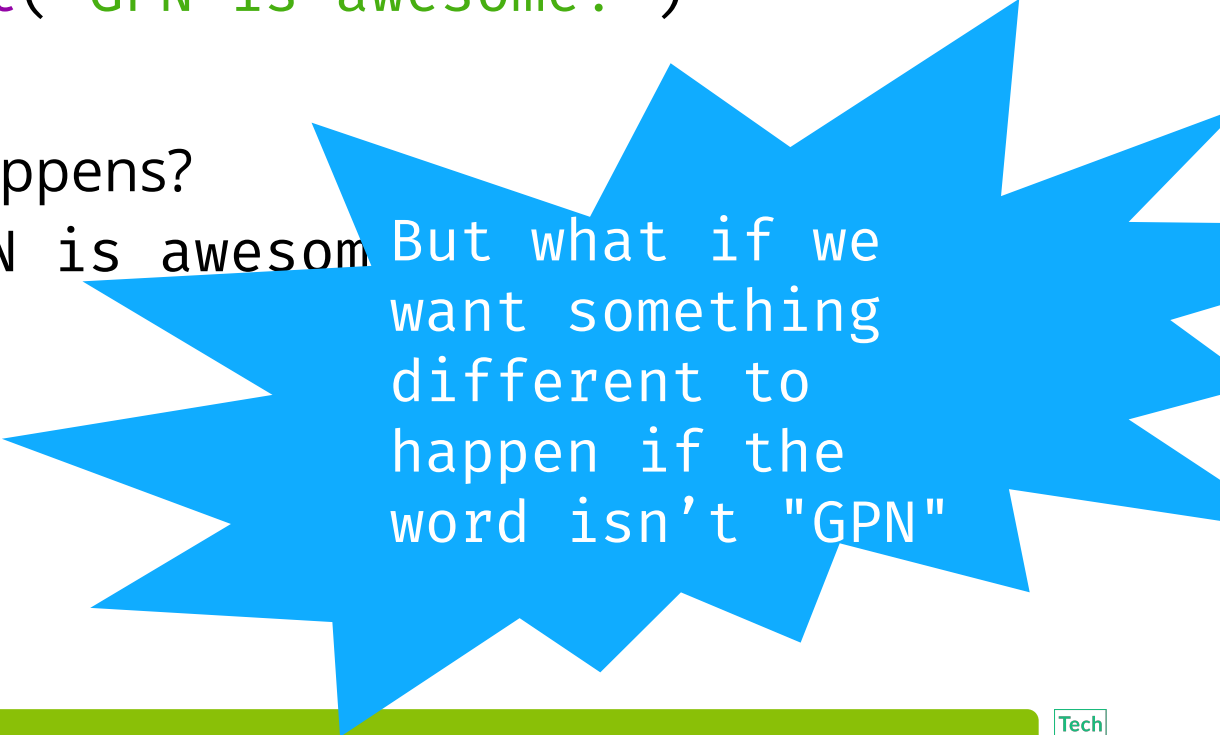

```
>>> GPN is awesome!
```

# If statements

```
word = "GPN"  
if word == "GPN":  
    print("GPN is awesome!")
```

What happens?

```
>>> GPN is awesome
```

But what if we  
want something  
different to  
happen if the  
word isn't "GPN"

# Else statements

**else**  
statements means  
something still  
happens if the **if**  
statement was  
**False**

```
word = "Chocolate"  
if word == "GPN":  
    print("GPN is awesome!")  
else:  
    print("The word isn't GPN :(")
```

What happens?

# Else statements

**else**  
statements means  
something still  
happens if the **if**  
statement was  
**False**

```
word = "Chocolate"  
if word == "GPN":  
    print("GPN is awesome!")  
else:  
    print("The word isn't GPN :(")
```

What happens?

```
>>> The word isn't GPN :(
```

# Elif statements

## **elif**

Means we can give specific instructions for other words

```
word = "Chocolate"
if word == "GPN":
    print("GPN is awesome!")
elif word == "Chocolate":
    print("YUMMM Chocolate!")
else:
    print("The word isn't GPN :(")
```

What happens?

# Elif statements

## **elif**

Means we can give specific instructions for other words

```
word = "Chocolate"
if word == "GPN":
    print("GPN is awesome!")
elif word == "Chocolate":
    print("YUMMM Chocolate!")
else:
    print("The word isn't GPN :(")
```

What happens?

```
>>> YUMM Chocolate!
```

# Lists

**When we go shopping, we write down what we want to buy!**

But we don't store it on lots of little pieces of paper!

We put it in one big shopping list!

- Bread
- Chocolate
- Ice Cream
- Pizza

# Lists

It would be annoying to store it separately when we code too

```
>>> shopping_item1 = "Bread"  
>>> shopping_item2 = "Chocolate"  
>>> shopping_item3 = "Ice Cream"  
>>> shopping_item4 = "Pizza"
```

So much repetition!

Instead we use a python list!

```
shopping_list = ["Bread", "Chocolate", "Ice Cream", "Pizza"]
```

# List anatomy

Stored in the  
variable  
shopping\_list

```
shopping_list = ["Bread", "Chocolate", "Ice Cream", "Pizza"]
```

# List anatomy

Stored in the  
variable  
shopping\_list

Made up of  
different items  
(these are strings)

shopping\_list = ["Bread", "Chocolate", "Ice Cream", "Pizza"]

# List anatomy

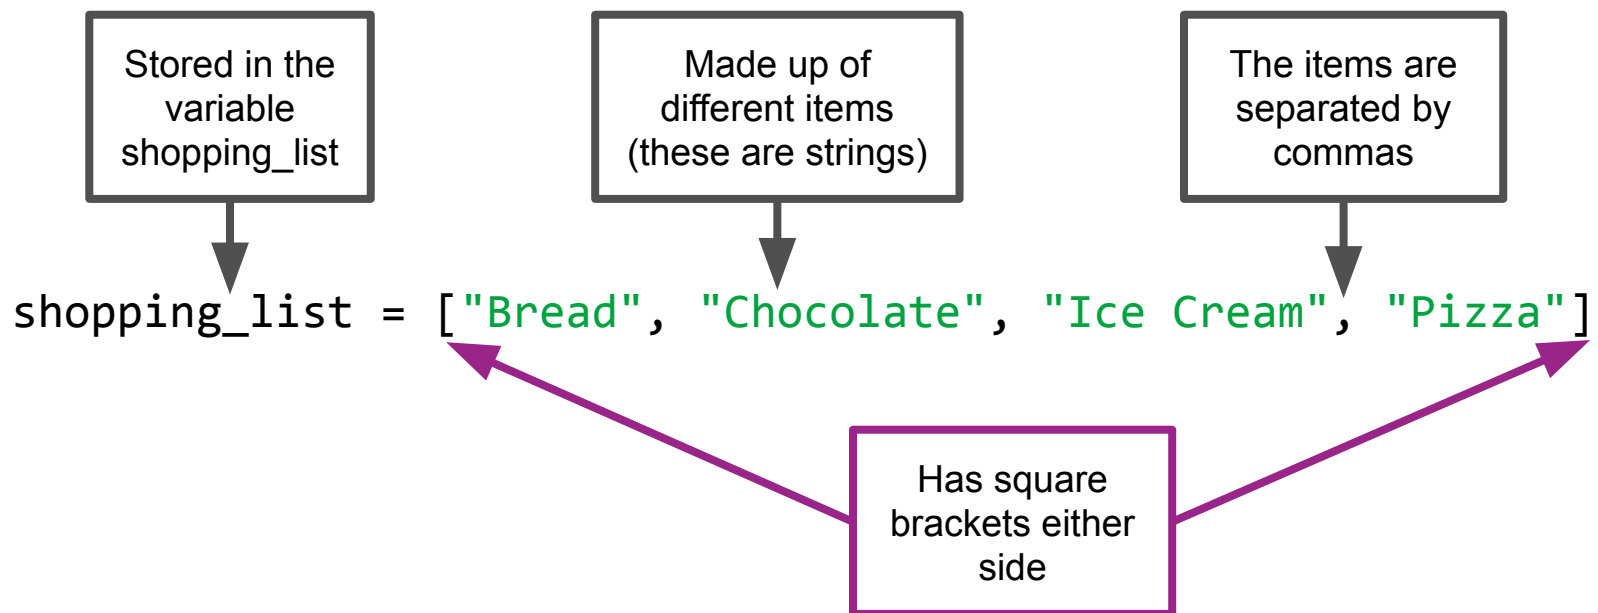

Stored in the  
variable  
shopping\_list

Made up of  
different items  
(these are strings)

The items are  
separated by  
commas

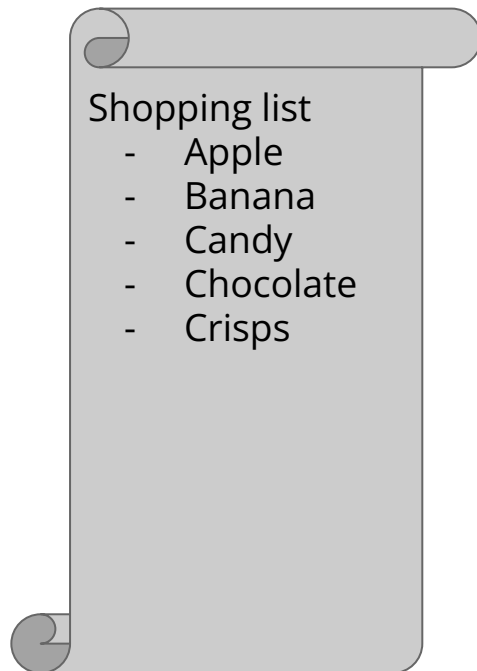

shopping\_list = ["Bread", "Chocolate", "Ice Cream", "Pizza"]

# List anatomy

# What's an index?

A list has many items, indexing lets us get one item from the list using its position number;

What is the fourth item I need to buy?

# What's an index?

A list has many items, indexing lets us get one item from the list using its position number;

What is the fourth item I need to buy?

chocolate!

# How do I know how long

We use indexes (or the position number) to pick an item in a list

```
fruits = ["apple", "banana", "cherry"]  
fruits[1]
```

The list we want  
to pick an item  
from

# How do I know how long

We use indexes (or the position number) to pick an item in a list

```
fruits = ["apple", "banana", "cherry"]  
fruits[1]
```

The name of the  
list

The list we want  
to pick an item  
from

# How do I know how long

We use indexes (or the position number) to pick an item in a list

```
fruits = ["apple", "banana", "cherry"]  
fruits[1]
```

The name of the  
list

The diagram consists of three boxes. The first box on the left is labeled 'The name of the list'. An arrow points from this box to the word 'fruits' in the code above. The second box in the middle is labeled 'The index (position) of the item'. An arrow points from this box to the number '1' in the code above. The third box on the right is labeled 'The list we want to pick an item from'. An arrow points from this box to the list of strings in the code above.

The index  
(position) of the  
item

The list we want  
to pick an item  
from

# But wait!

When we index, we start counting from 0

```
      0           1           2  
fruits = ["apple", "banana", "cherry"]  
fruits[1]
```

So we are actually picking the item "banana"

# Project Time!

You now know all about **if** and **lists**!

**See if you can do Lesson 3**

The tutors will be around to help!

Random!

# That's so random!

There's lots of things in life that are up to chance or random!

Python lets us **import** common bits of code people use! We're going to use the **random** module!

We want the computer to be random sometimes!

# Using the random module

Let's choose something randomly from a list!

This is like drawing something out of a hat in a raffle!

**Try this!**

**1. Import the random module!**

```
>>> import random
```

**2. Copy the shopping list into IDLE**

```
>>> shopping_list = ["eggs", "bread", "apples", "milk"]
```

**3. Choose randomly! Try it a few times!**

```
>>> random.choice(shopping_list)
```

# Using the random module

## You can also assign your random choice to a variable

```
>>> import random
>>> shopping_list = ["eggs", "bread", "apples", "milk"]
>>> random_food = random.choice(shopping_list)
>>> print(random_food)
```

# Project Time!

**Raaaaaaaaaandom! Can you handle that?**

Let's try use it in our project!

Try to do Lesson 4

The tutors will be around to

# For Loops

# For Loops

For loops allow you to do something a certain number of times.

We use them when we know exactly how many times we want to do something!

# For Loops

```
number = 10  
for i in range(number):  
    #Do something
```

# For Loops

```
number = 10
for i in range(number):
    #Do something
```

The `for` word tells python we want to use a loop

# For Loops

```
number = 10  
for i in range(number):  
    #Do something
```

The **for** word tells python we want to use a loop

This **i** is a temporary variable which will count how many times we have looped.

# For Loops

```
number = 10  
for i in range(number):  
    #Do something
```

This i is a temporary variable which will count how many times we have looped.

The **for** word tells python we want to use a loop

This part says we want to loop number amount of times (in this case, 10)

# For Loops

```
number = 10  
for i in range(number):  
    #Do something
```

This i is a temporary variable which will count how many times we have looped.

The **for** word tells python we want to use a loop

The code indented in the loop is what will happen every time.

This part says we want to loop number amount of times (in this case, 10)

# Looping how many times?

## We can loop through a list:

```
friends = 4  
for i in range(friends):  
    print("Hello friend!")
```

What's going to happen?

# Looping how many times?

## We can loop through a list:

```
friends = 4  
for i in range(friends):  
    print("Hello friend!")
```

What's going to happen?

```
>>> Hello friend!  
>>> Hello friend!  
>>> Hello friend!  
>>> Hello friend!
```

# Looping how many times?

## We can loop through a list:

```
friends = 4  
for i in range(friends):  
    print("Hello friend!")
```

What's going to happen?

```
>>> Hello friend!  
>>> Hello friend!  
>>> Hello friend!  
>>> Hello friend!
```

We do what's in the for loop as many times as what is in the "range"

# Project Time!

Now you know how to use a for loop!

**Try to do Lesson 5**  
**...if you are up **for** it!**

The tutors will be around to help!

# Dictionaries

# Dictionaries!

# Dictionaries!

***You know dictionaries!***

**They're great at looking up thing  
by a word, not a position in a list!**

Look up

***Hello***

Get back

***A greeting (salutation) said  
when meeting someone or  
acknowledging someone's  
arrival or presence.***

# Looking it up!

**There are lots of times we want to look something up!**

**Competition registration**

Team Name → List of team members

**Phone Book**

Name → Phone number

**Vending Machine**

Treat Name → Price

# Looking it up!

Phone Book

Name → Phone number

Key

Value

**We can use a dictionary for anything with a  
key → value pattern!**

# Dictionaries anatomy!

**This is a python dictionary!**

```
phone_book = {"Alex": 111, "Caitlin": 222, "Emma": 333}
```

**This dictionary has Alex, Caitlin and Emma's phone numbers**

# Dictionaries anatomy!

**This is a python dictionary!**

```
phone_book = {"Alex": 111, "Caitlin": 222, "Emma": 333}
```

Stored in the  
variable  
phone\_book

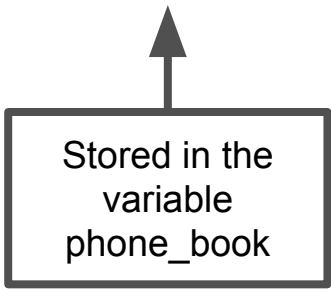

**This dictionary has Alex, Caitlin and Emma's phone numbers**

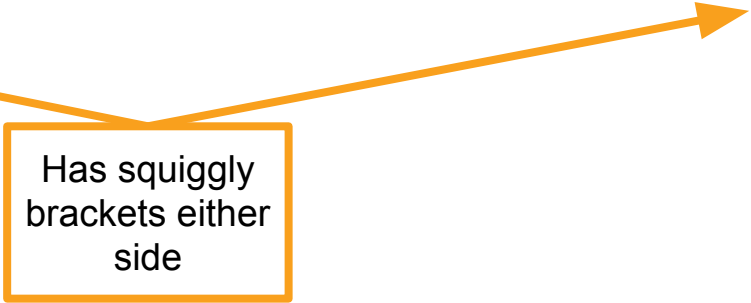

# Dictionaries anatomy!

**This is a python dictionary!**

```
phone_book = {"Alex": 111, "Caitlin": 222, "Emma": 333}
```

Stored in the  
variable  
phone\_book

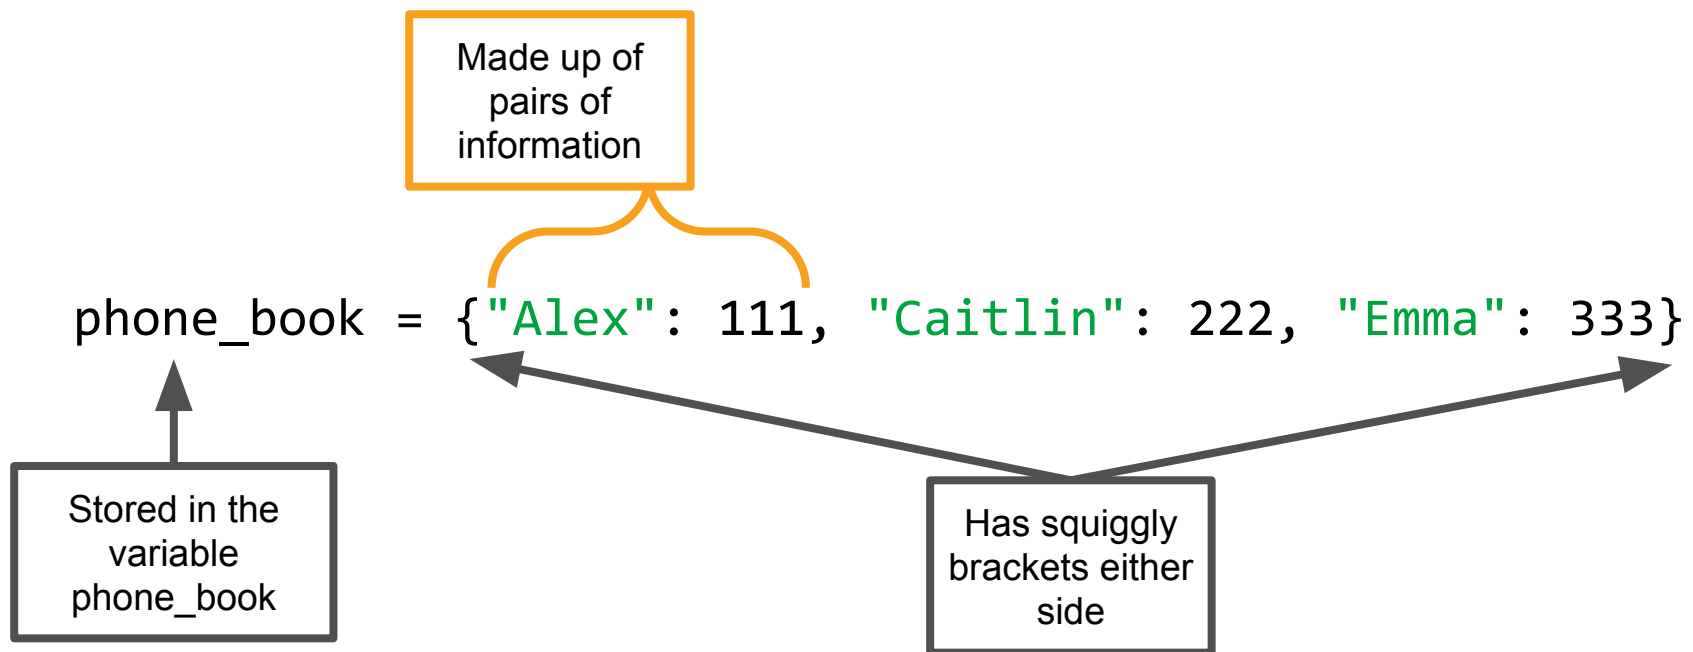

Has squiggly  
brackets either  
side

**This dictionary has Alex, Caitlin and Emma's phone numbers**

# Dictionaries anatomy!

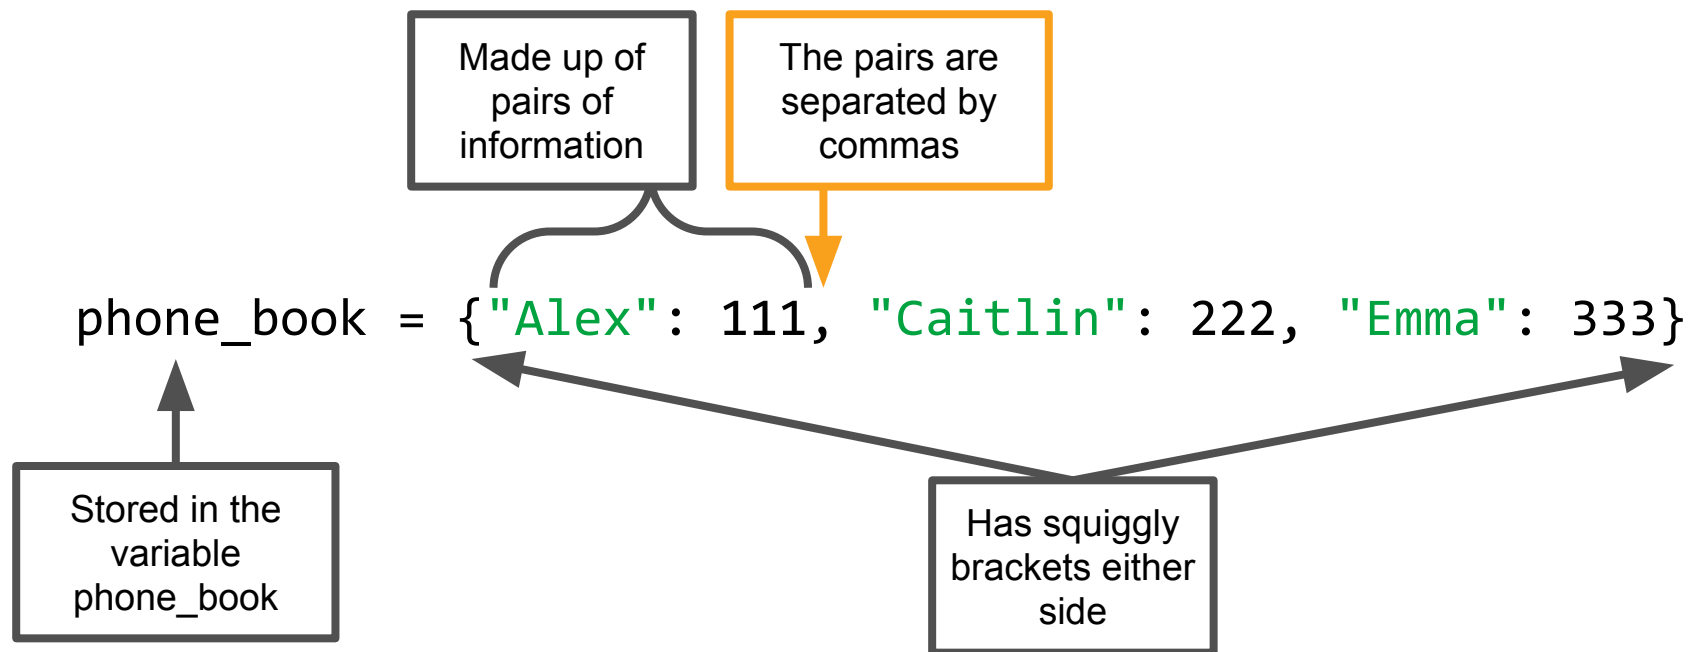

**This is a python dictionary!**

**This dictionary has Alex, Caitlin and Emma's phone numbers**

# Dictionaries anatomy!

**This is a python dictionary!**

**This dictionary has Alex, Caitlin and Emma's phone numbers**

# Dictionaries anatomy!

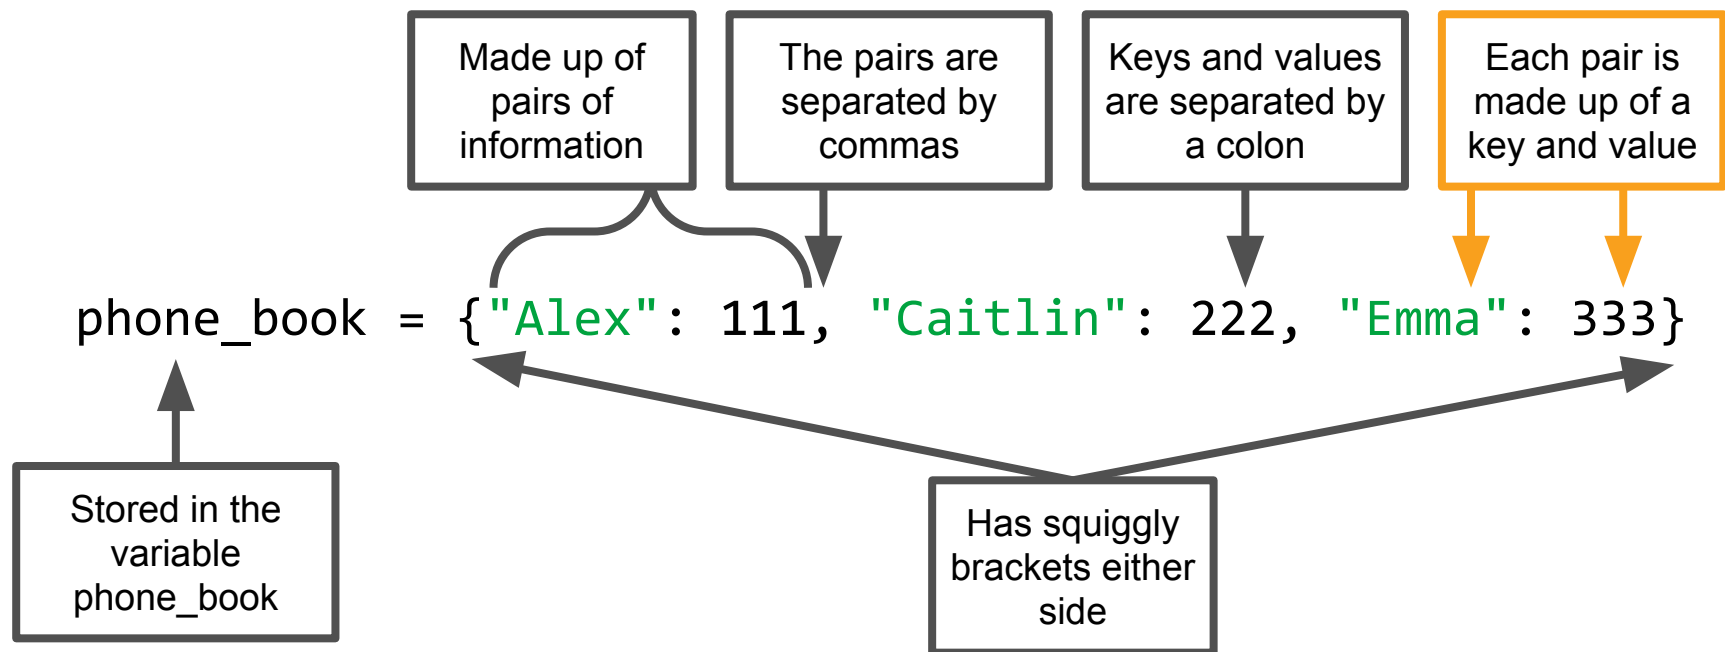

**This is a python dictionary!**

# Cups!!

**Remember the cups activity from the start of the day?**

# A Single Cup!

**The word “A”**

**can be followed by**

**Any of these words**

**Key**

**Value**

# A Single Cup!

The word “A” can be followed by Any of these words

We can store the slips of paper as a python list!

```
['house', 'mouse', 'house',  
'mouse', 'box', 'fox', 'box',  
'fox', 'house', 'mouse']
```

# A Single Cup!

The word “A” can be followed by Any of these words

We want to look up  
the word “a” and get  
back the list!

```
{ 'a' :  
  ['house', 'mouse', 'house',  
   'mouse', 'box', 'fox', 'box',  
   'fox', 'house', 'mouse']  
}
```

# A Single Cup!

**So we get a Dictionary with a List value!**

```
{ 'a' : ['house', 'mouse', 'house',  
         'mouse', 'box', 'fox', 'box',  
         'fox', 'house', 'mouse'] }
```

↑  
Key

↑  
Value

**If you look up “A” you get back a list of all the words that can follow “a”**

# Cups → Dictionary with lists!

Here's what it looks like for a few more cups!

```
cups = { 'am': [ 'Sam', 'That' ],  
        'In': [ 'a', 'a', 'a' ],  
        'a' : [ 'house', 'mouse',  
                'house', 'mouse',  
                'box', 'fox', 'box',  
                'fox', 'house',  
                'Mouse' ]  
        .... }
```

You can get the whole cup dictionary from today's website!

# Is it there?

We can check if something is a key in a dictionary like this:

```
cups = { 'am': [ 'Sam', 'That' ],  
        'In': [ 'a', 'a', 'a' ],  
        'a' : [ 'house', 'mouse',  
                'house', 'mouse',  
                'box', 'fox', 'box',  
                'fox', 'house',  
                'Mouse' ]  
        .... }
```

```
if current_word in cups:
```

# Project time!

You now know all about lists and dictionaries!

**Let's put what we learnt into our project**  
**Try to do Lesson 6 & 7**

The tutors will be around to help!

# More Dictionaries and Lists!

# Getting words from sample text

In order to be able to read in lots of text we need to be able to turn sentences into a list of words.

We can do this by using `.split()` on our text!

# Using split

```
text = "a really cool sentence"  
words = text.split()  
print(words)
```

What do you think words will be?

# Using split

```
text = "a really cool sentence"  
words = text.split()  
print(words)
```

What do you think words will be?

```
["a", "really", "cool", "sentence"]
```

# More things you can do with lists!

There's lots of cool things we can do with lists! Like:

Getting the length of a list

```
words = ["a", "really", "cool", "sentence"]  
print(len(words))
```

Adding new items to a list

```
words.append("yay")  
print(words)
```

# More things you can do with lists!

There's lots of cool things we can do with lists! Like:

Getting the length of a list

```
words = ["a", "really", "cool", "sentence"]
```

```
print(len(words))
```

4

Adding new items to a list

```
words.append("yay")
```

```
print(words)
```

# More things you can do with lists!

There's lots of cool things we can do with lists! Like:

Getting the length of a list

```
words = ["a", "really", "cool", "sentence"]
```

```
print(len(words))
```

4

Adding new items to a list

```
words.append("yay")
```

```
print(words)
```

```
["a", "really", "cool", "sentence", "yay"]
```

# Accessing Lists!

This favourites **list** holds four strings in order:

```
faves = ['books', 'butterfly', 'chocolate', 'skateboard']
```

We can count out the items using index numbers!

0

1

2

3

**Remember: Indices start from zero!**

# Accessing Lists

We access the items in a **list** with an index such as [0]:

```
>>> faves[0]  
'books'
```

What code do you need to access the second item in the list?

# Accessing Lists

We access the items in a **list** with an index such as [0]:

```
>>> faves[0]  
'books'
```

What code do you need to access the second item in the list?

```
>>> faves[1]  
'butterfly'
```

0

[1]

2

3

# Going Negative

Negative indices count backwards from the end of the **list**:

```
>>> faves[-1]  
'skateboard'
```

What would faves[-2] return?

# Going Negative

Negative indices count backwards from the end of the **list**:

```
>>> faves[-1]  
'skateboard'
```

What would faves[-2] return?

```
>>> faves[-2]  
'chocolate'
```

-4

-3

**[-2]**

-1

# Falling off the edge

Python complains if you try to go past the end of a **list**

```
>>> faves = ['books', 'butterfly', 'chocolate',  
             'skateboard']  
>>> faves[4]
```

```
Traceback (most recent call last):  
  File "<stdin>", line 1, in <module>  
IndexError: list index out of range
```

# Updating our dictionaries!

We've seen how to use dictionaries - but how do we update existing ones? Let's have a look at a phone book example!

```
>>> phone_book = {  
    "Alex": 111, "Caitlin": 222, "Emma": 333  
}
```

- We met Rowena! Let's add her to our phone book

```
>>> phone_book["Rowena"] = 444
```

```
>>> phone_book
```

```
{ "Alex": 123, "Caitlin": 222, "Emma": 333,  
  "Rowena": 444 }
```

# Lists in dictionaries!

We've been using lists as the values of our dictionary like this:

- Let's make some sports teams:

```
>>> team_members = {  
    "Sydney": ["Pauline", "Srishti", "Amara"],  
    "Perth": ["Crischell", "Ash", "Taylah"]  
}
```

- What happens if you do:

```
>>> team_members["Sydney"]
```

- What if we did this?

```
>>> team_members["Perth"].append("Priya")
```

# Lists in dictionaries!

We've been using lists as the values of our dictionary like this:

- Let's make some sports teams:

```
>>> team_members = {  
    "Sydney": ["Pauline", "Srishti", "Amara"],  
    "Perth": ["Criscell", "Ash", "Taylah"]  
}
```

- What happens if you do:

```
>>> team_members["Sydney"]  
["Pauline", "Srishti", "Amara"]
```

- What if we did this?

```
>>> team_members["Perth"].append("Priya")
```

["Pauline", "Srishti", "Amara", "Priya"]
```

# Project Time!

**Now you know even more about  
Dictionaries and Lists!**

**You can now try 8-11 in the Second  
part of your workbook!**

The tutors will be around to help!

# Files

# Opening files!

To get access to the stuff inside a file in python we need to **open** it!  
That doesn't mean clicking on the little icon!

```
f = open("test.txt")
```

You'll now be able to read the things in **f**

If your file is in the same location as your code you can just use the name!

# A missing file causes an error

Here we try to open a file that doesn't exist:

```
f = open('missing.txt')
```

```
Traceback (most recent call last):
```

```
File "<stdin>", line 1, in <module>
```

```
IOError: [Errno 2] No such file or  
directory: 'missing.txt'
```

# You can read a whole file into a string

```
>>> f = open('haiku.txt')  
>>> my_string = f.read()
```

```
>>> print(my_string)  
Wanna go outside.  
Oh NO! Help! I got outside!  
Let me back inside!
```

**haiku.txt**

Wanna go outside.  
Oh NO! Help! I got outside!  
Let me back inside!

# You can also read in one line at a time

**You can use a for loop to only get 1 line at a time!**

```
f = open('haiku.txt')  
for line in f:  
    print(line)
```

Wanna go outside.

Oh NO! Help! I got outside!

Let me back inside!

**Why is there an extra blank line each time?**

# Chomping off the newline

**The newline character is represented by '\n':**

```
print('Hello\nWorld')  
Hello  
World
```

**We can remove it from the lines we read with .strip()**

```
x = 'abc\n'  
x.strip()  
'abc'
```

**x.strip() is safe as lines without newlines will be unaffected**

# Reading and stripping!

```
for line in open('haiku.txt'):
    line = line.strip()
    print(line)
```

```
Wanna go outside.
Oh NO! Help! I got outside!
Let me back inside!
```

**No extra lines!**

# Using with!

**This is a special trick for opening files!**

```
with open("words.txt") as f:  
    for line in f:  
        print(line.strip())
```

**It automatically closes your file for you!**

It's good when you are writing files in python!

# Project Time!

**Now you can read some stuff**

**You can now try the third section  
of your workbook!**

The tutors will be around to help!
