

# **Girls' Programming Network**

Scissors Paper Rock!

# This project was created by GPN Australia for GPN sites all around Australia!

This workbook and related materials were created by tutors at:

Sydney, Canberra and Perth

Girls' Programming Network

If you see any of the following tutors don't forget to thank them!!

Writers Testers

Sarah MacLeod Renee Noble Vivian Dang Courtney Ross Pauline Kelly Meike Moeckel

# Part 0: Setting up

### Task 0.1: Making a python file

Open the start menu, and type 'IDLE'. Select IDLE 3.5.

- 1. Go to the file menu and select 'new file'. This opens a new window.
- 2. Go to the file menu, select 'Save as'
- 3. Go to the Desktop and save the file as 'scissors\_paper\_rock.py'

### Task 0.2: You've got a blank space, so write your name!

At the top of the file use a comment to write your name! Any line starting with # is a comment.

# This is a comment

### **™** CHECKPOINT **™**

— 31.231 3111. —					
If you can tick all of these off you can go to Part 1:					
☐ You should have a file called scissors_paper_rock.py					
$\square$ Your file has your name at the top in a comment					
☐ Run your file with F5 key and it does nothing!!					

# Part 1: Welcome Message

### Task 1.1: Print a welcome and the rules

Welcome the player and print the rules!

Use a print to make it happen when you run your code:

```
Welcome to Human vs. Computer in Scissors, Paper, Rock!

Moves: choose scissors, paper or rock by typing in your selection.

Rules: scissors cuts paper, paper covers rock and rock crushes scissors.

Good luck!
```

### Hint

Want to print multiple lines at a time? You can use three sets of quotes instead of one, to make your strings go over multiple lines

```
print("""
Print
Three
Lines
""")
```

<b>√</b>	$\mathbf{CH}$	FC	KP	$\mathbf{O}\mathbf{I}$	NT	V

If you can tick all of these off you can go to Part 2:	
☐ Print a welcome	
☐ Print the rules	
☐ Try running your code!	

# 2. Who played what?

### Task 2.1: Make computer play the same move every time!!

Make a variable for the computer's move such as computer\_move, set it to one of "scissors", "paper" or "rock".

### Task 2.2: Ask the human for their move

Use **input** to ask the human for their move and save their answer in a variable, name it something like **human** move.

It should look like this when you run your code:

```
Welcome to Human vs. Computer in Scissors, Paper, Rock!

Moves: choose scissors, paper or rock by typing in your selection.
Rules: scissors cuts paper, paper covers rock and rock crushes scissors.
Good luck!

What is your move? scissors, paper or rock?
```

### Task 2.3: Print out the moves

Print out the moves the computer and the human have played.

It should look like this when you run your code:

```
Welcome to Human vs. Computer in Scissors, Paper, Rock!

Moves: choose scissors, paper or rock by typing in your selection.
Rules: scissors cuts paper, paper covers rock and rock crushes scissors.
Good luck!

What is your move? scissors, paper or rock? scissors

Computer Played: paper
Human Played: scissors
```

☐ CHECKPOINT ☐				
If you can tick all of these off you can go to Part 3:				
☐ Set a move for the computer				
$\square$ Ask the human to type in their move and store it in a variable				
☐ Print out the human and computers moves				
Run your code!				

### ★ BONUS 2.4: Not so fast!!

This would look cooler if the computer paused before it said each line!

- 1) At the top of your file write import time
  This will let us use what we need to use to make our program sleep for a few seconds.
- 2) Before any print, add a line that says time.sleep(0.1)
  This will make our program 'sleep' for a tenth of a second! You can adjust it to any time you want. Try putting sleep between your print statements!

### ★ BONUS 2.5: Personalise the game

### Waiting for the next lecture? Try adding this bonus feature!!

- 1. At the start of the game ask the human to enter their name. Store it in a variable (maybe use player name)
- 2. Change your other code so that every time it says "Human" it prints the player's name instead!

Remember you can add a variable to some text like this:

"Hello " + player name

# 3. Win, lose or tie?

Let's figure out who won the game!

### Task 3.1: What are the different ways to win, lose and tie?

What are all the combinations of how the game could go? Finish this table:

Human Move	Computer Move	Who Wins?
scissors	scissors	draw
scissors	paper	human
scissors	rock	computer
paper	scissors	computer
paper		

### Task 3.2: Calculate and print the winner

Use if and elif statements to calculate the 9 different combinations above.

You should print out the winner inside your if and elif once you know the result!

### Hint

You can check a particular combination of moves with code like this:

```
if computer_move == "paper" and human_move == "scissors":
    print("Human won the round!")
```

# If you can tick all of these off you can go to Part 4: ☐ Compare every possible combination of moves ☐ Print out the winner ☐ Run your code and test different moves! ☐ Test when you input "ROCK" or "Rock" instead of "rock", what happens?

### ★ BONUS 3.3: ROCK Rock rOcK!

Waiting for the next lecture? Try adding this bonus feature!!

We can use word = word.lower() to change what the user entered to lower case. Update your code so we're always using the lowercase version of what your user entered!

### ★ BONUS 3.3: Name the winner!

Waiting for the next lecture? Try adding this bonus feature!!

Update your code so that instead of saying "The winner is human" refer to the human by name, using the name you collect in Bonus 2.5.

# 4. Smarter Computer

The computer keeps playing the same move! That's no fun! Let's make the computer chose a random move!

Random

### **Task 4.1: Import Random Library**

To get access to cool random things we need to import random!

At the top of your file add this line:

import random

### Task 4.2: Chose a random move!

Find your line of code where you set your computer move, improve this line by choosing a random move.

Choose a random move for the computer using random.choice from a list of "paper", "scissors" and "rock".

### Hint

If I wanted to choose a random food for dinner I could use code like this:

dinner = random.choice(["pizza", "chocolate", "nutella",
 "lemon"])

### **☑** CHECKPOINT **☑**

### If you can tick all of these off you can go to Part 5:

	The computer	<sup>·</sup> plays a	random	move	every time.
--	--------------	----------------------	--------	------	-------------

☐ The line "Computer played: ...." prints different things out!

☐ Try different moves against the computer, does the the correct winner print?

### ★ BONUS 4.3: A picture says a thousand words!

### Waiting for the next lecture? Try adding this bonus feature!!

Instead of printing "The human played paper" it would be much cooler to print a picture of a paper! Use ascii art to print images for what the human and computer played!

```
Human plays paper:
 I AM
A SHEET
OF PAPER
```

- 1. Go to this link: <u>girlsprogramming.network/ascii</u> and get the pictures for paper, scissors and rock!
- 2. At the top of your code, store each of these ascii images as a string in different variables (maybe rock\_pic, paper\_pic, etc ... )
- 3. Instead of just printing out the word the human or computer played, also print out the correct picture to match what they played. You might need to use an if statement to figure out which picture to print!

# 5. Again, Again, Again!

We want to play Scissors-Paper-Rock more than once! Let's add a loop to play on repeat!

### Task 5.1: Loop time!

Create a while loop that runs forever, so we can play as much as we want!

You'll need to use:

- A while loop
- A True statement

The while loop will run as long as what comes after the while is true. The easiest way to do this is using a boolean True.

Use this line to make the game play on repeat

while True:

### Task 5.2: Indenting your code

Things we want to do every game need to be indented inside the loop. We want to ask for a move and check the winner every round!

### Hint

Indented lines have a tab (the big empty space) at the start like this, they look this:

while True:
 # THIS IS INDENTED

### **☑** CHECKPOINT **☑**

If you can tick all of these off you can go to Part 6:	
☐ Create a while loop that constantly runs!	
☐ Your game code is inside the while loop	
☐ The game never ends!	

# 6. Extension: How Many Games?

Instead of running infinite times, we now want to run as many as times as the user wants!

For Loops

### Task 6.1: How many games?

Find out how many games the user wants to play at the start of the game! Put this after your welcome message!

### Hint

Input returns a **string**. Make sure you **convert it to an int** and store it in a variable!

int ("57") will give you back 57. You can use int (...) on a variable too!

### Task 6.2: Loop time!

**REMOVE the while loop you made in section 5.** Instead, create a for loop that runs as many times as the user asked for!

You'll need to use:

- A for loop
- range(number of games)

Use this line after you have asked how many games they want to play:

```
for i in range(number_games):
```

### Task 6.3: Indenting your code

Things we want to do every game need to be indented inside the loop. We want to ask for a move and check the winner every round!

### Hint

Indented lines have a tab at the start like this, they look this:

```
for blah in something:
    THIS IS INDENTED
```

### Task 6.4: GAME OVER!

After all the rounds are played, print out "GAME OVER!".

Make sure this is after your loop and doesn't print every round!

# 7. Extension: Keeping Score!

Do "Extension 6: How Many Games" first, then you can do this extension
Why play lots of games if we're not even keeping count of who wins?? Let's keep score!

### Task 7.1: Counter!

Before your loop create 2 variables, these are going to be your human and computer counters. Start by setting them both to 0.

These will keep track of the human and computer scores throughout the game!

### Task 7.2: Add 1!

Every time the computer or human wins we need to add one to the appropriate counter If it's a tie neither player gets a point!

### Hint

You'll need to add to a counter inside your if/elif statements whenever someone wins!

### Task 7.3: And the winner is!

After all the games are played we need to report the over all winner.

Print out how many games the human can computer won each.

Then print out who the overall winner was!

```
GAME OVER!
Human won 5 games
Computer won 2 games
Human is the winner!!
```

### Hint

Use an if statement to compare the scores to calculate the overall winner!

### ★ CHALLENGE 7.4: First to X

Right now we play a set number of games. But can you figure out how you could change your program to keep playing until a player gets a certain number of points?

You might need to use a while loop, or a break, or something else you can think of!

## 8. Extension: That's not a real move!

What happens if the human plays a wrong move, like Batman? Or what happens if the human doesn't write their move in lowercase letters and plays ROCK, Rock or ROcK? Test your code and find out!

There are a few little issues with our code so far:

- If the human inputs an incorrect move the program doesn't notice!
- If the human inputs a move which is not written in lowercase letters, they will lose the game. (Unless you already did the bonus task 3.3!)

We need to make our code more robust! Let's see what we can do to fix these issues!

7a. Inputting a move which is not case sensitive

To compare the human's move to the list moves, the strings need to look the same. We can make sure that the moves we are comparing have the same case as the moves in the list by calling the lower() function. For example, to make the variable word lowercase, you would write:

```
word = word.lower()
```

Notice the dot, this is important!

### Task 8.1: Check the move is valid!

Create a while loop that runs until the user enters a valid move of "scissors", "paper" or "rock".

If the move isn't valid, ask the user for their move again!

### ★ CHALLENGE 8.2: Game Over! Shut Down! ★

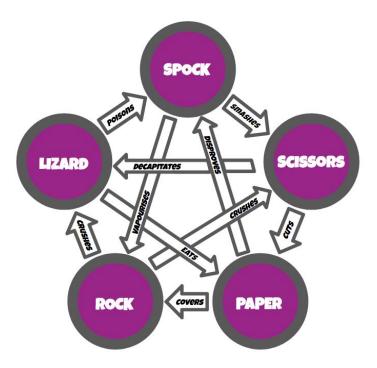

Sometime the user might say they want to play a certain number of rounds, but has to leave before the rounds are finished.

Create an if statement that checks to see if the user entered "quit" as their move, and close the game down.

Don't forget to tell the user who the overall winner was!

# 9. Extension: Scissors, Paper, Rock, Lizard, Spock!

Let's add some more moves and play Scissors, Paper, Rock, Lizard, Spock! Follow the arrows in the picture to see who wins!

### Task 9.1 Updated moves!

When you ask the user what move they want to play, include lizard and spock!

Make sure you give the computer the same options!

### Task 9.2 Updated combos!

Add more elif statements to make all your extra options possible! (There's a table on the back of this sheet you can use to figure out the options)

### ★ CHALLENGE 9.3: Too much elifs!!

Woah that dictionary got big! It's got 25 combinations. But what if we dealt with all the ties in one if statement!

Use a single if statement to find all the ties, by comparing the human computer moves!

Human Move	Computer Move	Who Wins?
scissors	scissors	
scissors	paper	
scissors	rock	
scissors	lizard	
scissors	spock	
paper	scissors	
paper	paper	
paper	rock	
paper	lizard	
paper	spock	
rock	scissors	
rock	paper	
rock	rock	
rock	lizard	
rock	spock	
lizard	scissors	
lizard	paper	
lizard	rock	
lizard	lizard	
lizard	spock	
spock	scissors	
spock	paper	
spock	rock	
spock	lizard	
spock	spock
