

Co Op Bop solutions for tutors

Get a Co Op game going in your room. Great for everyone, including complete beginners!

Student code

The code to create an individual button for a student is simple:

Using the microbit built in buttons

```
from microbit import *
import radio

radio.config(channel=6)
radio.on()
while True:
    display.show(Image.ARROW_E)
    if(button_a.was_pressed()):
        radio.send("bop")
```

Using pins and circuit buttons

```
from microbit import *
import radio

pin0.read_digital()

radio.config(channel=6)
radio.on()
while True:
    display.show(Image.ARROW_E)
    If pin0.read_digital():
        radio.send("bop")
```

Students can change the orange highlighted parts to name their action anything or use any of the standard images.

Joining the buttons together (GAME MASTER CODE)

For beginner classrooms there might not be anyone who is able to code the Game Master. But it's easy for tutors to copy this code and add students to a game for the whole room.

A tutor can code this up and add each student button to the game. Look at the yellow highlighted parts to get the bits to duplicate for each student. Make sure each student picks a unique action name and a unique picture to add to the game.

Feel free to extend the game time (pink highlight)

```
# GPN CO OP BOP IT - Master side
from microbit import *
import random
import radio

# Starting the game with an image
display.show(Image.TARGET)
sleep(1000)

# Setting up the radio
radio.on()
radio.config(channel=6)

# Setting up the game
score = 0
actions = ["bop", "pull"]

action = random.choice(actions)

while running_time() < 10000:
    # If the action is bop
    if action == "bop":
        display.show(Image.ARROW_W)

    # If the action was pull
    if action == "pull":
        display.show(Image.ARROW_E)

    if radio.receive() == action:
        print(radio.receive())
        display.show(Image.HAPPY)
        score = score + 1
    else:
        continue

    sleep(200)
    action = random.choice(actions)
display.scroll(str(score))
```
