# Other Chess Pieces?

We know we can fit 8 Queens on an 8x8 chessboard, but what happens if we change the chess piece?

See if you can find the maximum possible number of pieces that fit happily together for each of the following types.

I want to be able to run all the way to the edge: up down, left and right!!

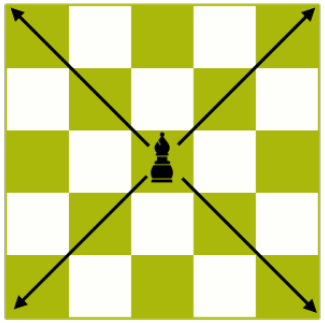

How many **Rooks** can you fit?

What are their co-ordinates?

I want to be able to run all the way to the edge on the diagonal!

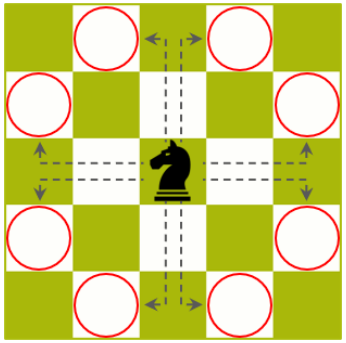

How many **Bishops** can you fit?

What are their co-ordinates?

I want to be able to run all the way to the edge on the diagonal!

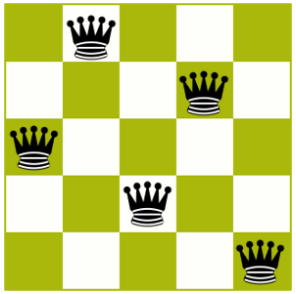

How many **Knights** can you fit?

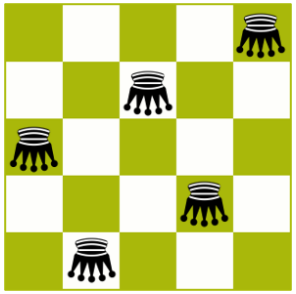

What are their co-ordinates?

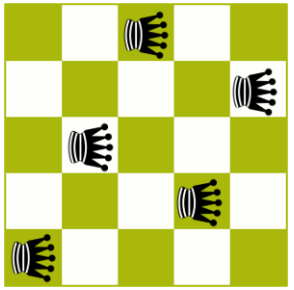

# Multiple Solutions?

You may have noticed that for many of the problems, there are *multiple* solutions.

Look here's an example!

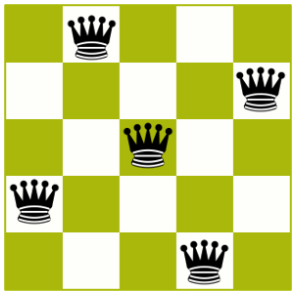

But wait, on first look they may seem like *unique solutions*- however, we can see they are just variations!

2 is 1 flipped vertically!
3 is 1 rotated 90*!

This means they are isomorphic and are not *really new solutions!*
A new solution following would be one like this, which cannot be transformed to match the first, making it non-isomorphic!

I'm unique!

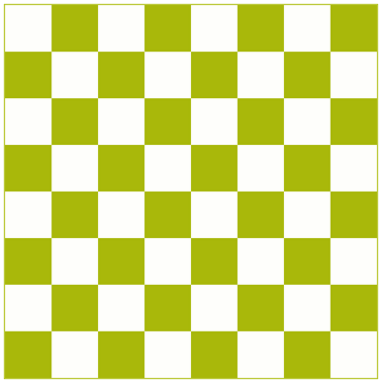

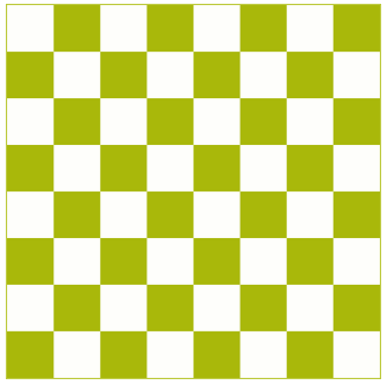

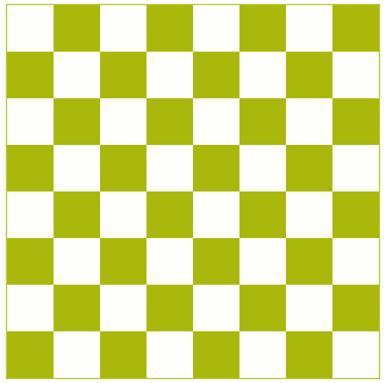

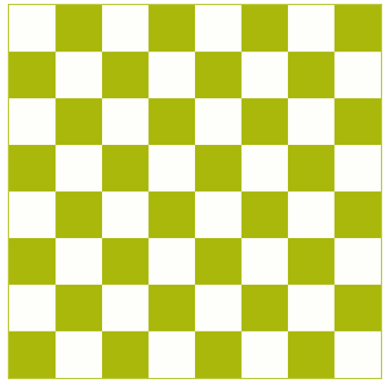

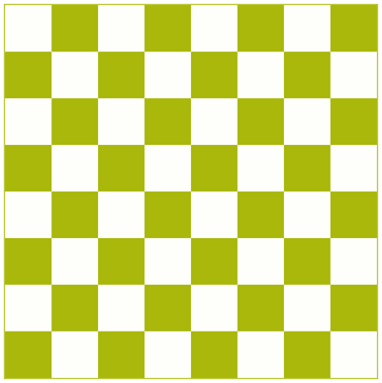

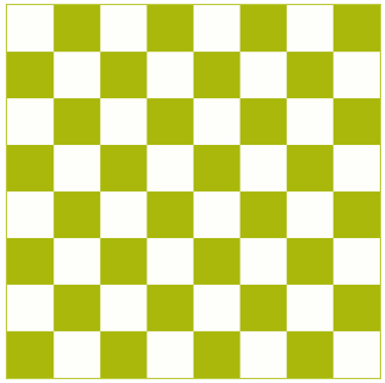

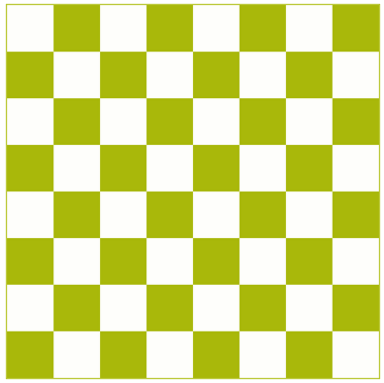

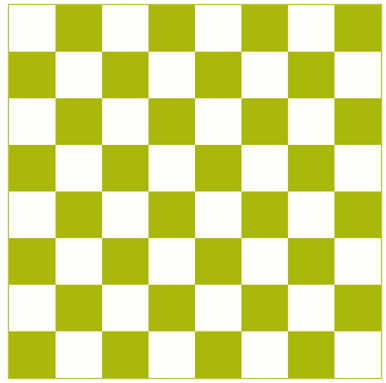

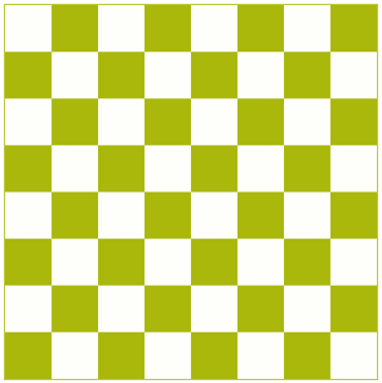

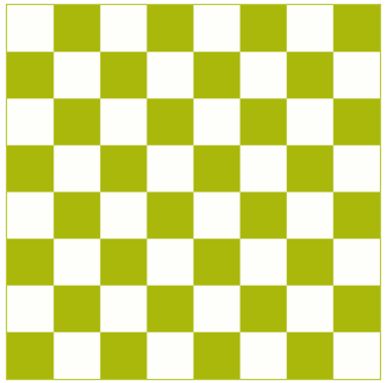

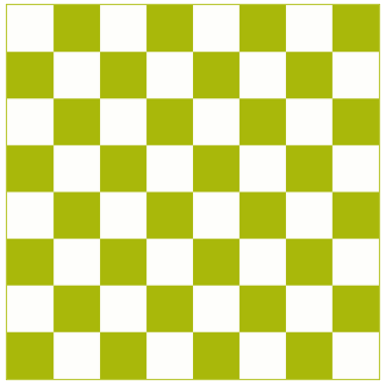

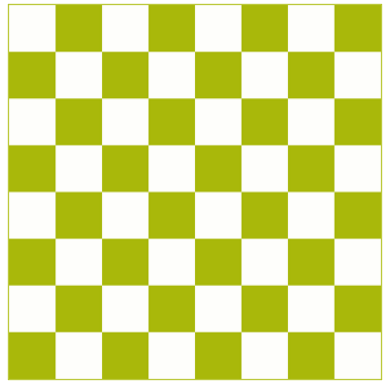

**A new challenge:**
Can you find more non-isomorphic solutions for the 8 queens problem?

There are 12 to be found for the 8x8 chessboard.

# 8 Queens

Just a bunch of 8x8 grids to use as a working out space

# 8 Queens

Can you fit 8 queens on a 8x8 chessboard?
